

Work In Progress

Water Supply Improvement

Wellhead Treatment for VOC Removal

Phase 1 - Stations 15A & 15C/E

Placed in service: May, 2018. Project Scope

As part of our commitment to providing a safe and reliable supply of high quality drinking water for our customers, we are bringing select wells back into service upon installation of wellhead treatment for the removal of volatile organic compounds (VOCs) commonly found in Long Island's groundwater. By increasing the reliability and availability of drinking water supply in our service area, we will be better able to serve our customers and have more resources to respond to emergency situations. Phase 1

Station Number 15A: The existing building will be replaced with a new energy efficient building and setup for off-site future wellhead treatment.

Station Number 15 C/E: Construction of a new energy efficient treatment building, rehabilitation of the existing building, and installation of a new emergency standby generator.
